

FULL COMPLEMENT NEEDLE BEARINGS

Technical features

Full complement needle bearings

Full complement needle bearings have a through-hardened outer ring which results in high static and dynamic load capacities and an ability to withstand overloading, shocks and vibration.

They are particularly suitable for operations involving oscillating motion but may also accept high speed conditions where good alignment is necessary. This can more easily be achieved using a convex inner ring raceway (inner rings with suffix R6).

The retention of the needles in the outer ring enables the bearing to be installed easily during assembly.

The difference between the needle bearings with integral end flanges series 3000 and the others is explained in the Chapter of the Bearings with cages.

These bearings are available with or without an inner ring from 12 mm bore size. Standard complete bearings type **NA** have an inner ring with convex raceway form. If extra wide inner rings or rings with lubrication hole are required, they should be ordered separately for use with the corresponding **RNA** series.

Reference standards are:

- **ISO 1206** - Needle roller bearings – Light and medium series – Dimensions and tolerances.

FULL COMPLEMENT BEARINGS WITHOUT INNER RING

The shaft journal which is used directly as the inner ring raceway of the bearing should have adequate hardness and satisfactory surface finish. A hardness of 58-64 HRC will ensure full load capacity for the bearing. Lower hardness figures will entail a reduction in both static and dynamic capacities as shown in the table of dimensions (see Technical Section).

In cases of misalignment, a convex inner ring raceway can be machined directly at the shaft journal position by grinding, using a concave profile and inclining the diamond impregnated grinding wheel. A convex inner ring raceway calculated to permit misalignment of 1 in 1000 does not affect bearing load capacity. A larger convex radius is necessary for a greater degree of misalignment but this will reduce the effective bearing load capacity.

TYPES OF BEARINGS

Needle roller bearings with inner rings

NA Series 1000, 2000, 22000

NA Series 3000

Needle roller bearings without inner rings

RNA Series 1000, 2000, 22000

RNA Series 3000

Technical features

Full complement needle bearings

INNER RINGS

Inner rings made from high quality bearing steel heat treated and through-hardened avoid any necessity for heat treatment of the shaft and enable the bearings to operate within their full load capacity.

Inner rings with convex raceway "R6"

These inner rings without lubrication hole are of the same width as the outer ring and are supplied with series **NA** complete, types **1000**, **2000**, **22000** and **3000**. They can accept a misalignment of 1 in 1000 in continuous operation and up to 2 in 1000 temporarily, as in the case of sudden deflection due to overload conditions. The inner and outer rings may be displaced axially from one to the other by up to 5% of the ring width. The designation of the inner ring separated from the complete needle bearing is **BI** number **R6**. For example **BI 2020 R6**. The designation of the needle bearings complete of inner ring **BI...R6** is **NA** number. For example **NA 2035**.

Inner rings with cylindrical raceway

Cylindrical inner rings of the same bore as those with convex raceway may be supplied on request in the following versions:

- with oil hole permitting lubrication through the shaft (**BIC**).
- wider than corresponding outer ring (**BICG**), to enable a displacement in position of one ring relative to the other (e.g. expansion of the shaft) or lateral shaft movement. In the latter case, which can occur with or without simultaneous rotation of the shaft, please consult Nadella Technical Service.

The use of cylindrical inner rings with standard bearings type **RNA** series **1000**, **2000**, **22000** and **3000** requires that the housing and shaft be correctly aligned at assembly with due regard to the application under load. If it is not essential to use these inner rings, it is always preferable to use complete bearings type **NA** with convex inner rings type "**R6**", without oil hole, of the same width as the outer ring. In particular cases where lubrication is provided through the shaft, the inner ring with oil hole may be replaced by a lubrication hole at the face of the inner ring.

RING TOLERANCES

Inner and outer rings for full complement standard needle bearings are manufactured in accordance with the tolerance class of ISO Standard 492 (class zero according to DIN 620). Closer tolerances, corresponding to classes 6, 5 and 4 may be necessary for special high precision applications (symbols P6, P5, P4). See table at the end of the catalogue.

RADIALPLAY

Bearings without inner ring

The radial play of a bearing without inner ring results from the difference in diameter beneath the needles and the size of the shaft. The standard diameter beneath the needles for RNA bearings with the recommended shaft tolerances should provide suitable radial play for most normal applications.

For special applications (high precision, close fits, etc.), we can offer the diameter beneath the needles selected as follows:

- in the bottom half of the normal tolerance (**RNA ... TB**)
- in the upper half of the normal tolerance (**RNA...TC**).

Bearings without inner ring tolerance Class **TB** mounted on a shaft with k5 tolerance will have a reduced radial play suitable for certain applications.

Nominal dimension F_w mm		Tolerance of diameter under needles		
		normal μm	Selected TB μm	Selected TC μm
above	to			
5	15	+20 + 40	+20 + 31	+ 29 + 40
15	25	+20 + 43	+20 + 33	+ 30 + 43
25	30	+25 + 48	+25 + 38	+ 35 + 48
30	35	+30 + 53	+30 + 43	+ 40 + 53
35	60	+35 + 58	+35 + 48	+ 45 + 58
60	80	+45 + 73	+45 + 60	+ 58 + 73
80	115	+50 + 78	+50 + 65	+ 63 + 78
115	180	+60 + 88	+60 + 75	+ 73 + 88
180	220	+70 +103	+70 + 88	+ 85 +103
220	270	+80 +113	+80 + 98	+ 95 +113
270	350	+90 +128	+90 +110	+108 +128
Examples of bearing		RNA 1020	RNA 1020 TB	RNA 1020 TC

A nominal diameter under the needles further reduced may be required for certain precision.

Should a larger clearance than normal be necessary, the shaft diameter must be controlled nearer to the nominal size than the tolerances h5 or g5 would normally provide.

Technical features

Full complement needle bearings

Standard complete bearings with inner ring

Complete bearings type **NA** are offered with a radial play that is suitable for the majority of applications. They can be supplied if necessary:

- with the radial play selected from the bottom half of the normal tolerance (**NA...TB**)
- with the radial play selected from the upper half of the normal tolerance (**NA...TC**).

For bore dimensions $d > 130$ mm, bearings **NA...TB** or **NA...TC** are supplied only on special request.

Radial play of full complement bearings with convex inner ring "R6".

Full complement needle bearings

BEARING MOUNTING

General requirements

In general, the mounting of needle roller bearings with or without inner rings, of normal precision, requires the shaft seat or raceway to be machined to quality IT5 or IT6. The housing bore should meet quality IT6 or IT7. Other quality requirements for shaft and housings are given on page 13.

MOUNTING DIMENSIONS

It is recommended that needle roller bearings are mounted in their housings with a clearance fit if the load is stationary relative to the housing, and with a tight transition fit if the load rotates relative to the housing.

Table 2 lists the recommended tolerances for the housing bore and the shaft raceway for bearings without inner rings. Table 3 lists the recommended shaft tolerances for the above two mounting conditions when the bearings are used with inner rings.

Other mounting dimensions may be required for special operating conditions such as:

1. Extremely heavy radial loads
2. Shock loads
3. Temperature gradient across bearing
4. Housing material with heat expansion coefficient different to that of the bearing
5. Oscillating movements

Table 2- Mounting tolerances for bearings without inner ring

Rotation conditions	Nominal housing bore diameter D mm	ISO tolerance zone for housing	Nominal shaft diameter F mm	ISO tolerance zone for shaft
Load stationary relative to housing	All diameters	J6	All diameters	h5
Load rotates relative to housing	All diameters	M6	All diameters	g5

NOTE: Care should be taken that the selected bearing internal clearance is appropriate for the operating conditions. Details of shaft and housing quality requirements are given on pages 13 and 14.

Table 3- Shaft tolerances for bearings with inner rings

Rotation conditions	Nominal shaft diameter d mm		ISO tolerance zone for shaft	Nominal housing bore diameter D mm	ISO tolerance zone for housing
